A KEY TO THE SPECIES OF OPHIUROIDEA
(BRITTLE STARS) OF THE SANTA MONICA BAY
AND ADJACENT AREAS

By RICHARD A. BOOLOOTIAN AND DAVID LEIGHTON
CONTRIBUTIONS IN SCIENCE is a series of miscellaneous technical papers in the fields of Biology, Geology and Anthropology, published at irregular intervals by the Los Angeles County Museum of Natural History. Issues are numbered separately, and numbers run consecutively regardless of subject matter. Number 1 was issued January 23, 1957. The series is available to scientific institutions on an exchange basis. Copies may also be purchased at a nominal price.

INSTRUCTIONS FOR AUTHORS

Manuscripts for the LOS ANGELES COUNTY MUSEUM CONTRIBUTIONS IN SCIENCE may be in any field of Life or Earth Sciences. Acceptance of papers will be determined by the amount and character of new information and the form in which it is presented. Priority will be given to manuscripts by staff members, or to papers dealing largely with specimens in the Museum's collections. Manuscripts must conform to CONTRIBUTIONS style and will be examined for suitability by an Editorial Committee. They may also be subject to critical review by competent specialists.

MANUSCRIPT FORM.—(1) The 1960 AIBS Style Manual for Biological Journals is highly recommended as a guide. (2) Typewrite material, using double spacing throughout and leaving ample margins, on only one side of 8½ x 11 inch standard weight paper. (3) Place tables on separate pages. (4) footnotes should be avoided if possible. (5) Legends for figures and unavoidable footnotes should be typed on separate sheets. Several of one kind may be placed on a sheet. (6) Method of literature citation must conform to CONTRIBUTIONS style—see number 90 and later issues. Spell out in full the title of non-English serials and places of publication. (7) A factual summary is recommended for longer papers. (8) A brief abstract must be included for all papers. This will be published at the head of each paper.

ILLUSTRATIONS.—All illustrations, including maps and photographs, should be referred to as "figures." All illustrations should be of sufficient clarity and in the proper proportions for reduction to CONTRIBUTIONS page size. Permanent ink should be used in making line drawings and in lettering (do not type on drawings); photographs should be glossy prints of good contrast. Original illustrations will not be returned unless specifically requested when the manuscript is first submitted.

PROOF.—Author will be sent galley proof which should be corrected and returned promptly. Changes after the paper is in galley will be billed to the author. Unless specially requested, page proof will not be sent to the author. 100 copies of each paper will be given free to a single author or divided equally among multiple authors. Orders for additional copies should be sent to the Editor at the time corrected galley proof is returned; appropriate forms for this will be included when galley is sent.

DAVID K. CALDWELL

Editor
A KEY TO THE SPECIES OF OPHIUROIDEA
(BRITTLE STARS) OF THE SANTA MONICA BAY
AND ADJACENT AREAS\(^1\)

By RICHARD A. BOOLOOTIAN\(^2\) and DAVID LEIGHTON\(^3\)

ABSTRACT: Thirty ophiuroid species occur off the coast of
Southern California. The bathymetric range, color in life, habitat,
and meristic characteristics are considered. A dichotomous key
is presented.

Southern California ophiuroids are now well catalogued, although no
key to the species existing in any geographically distinct region of the California
shore and the continental shelf between La Jolla and Monterey has been pre-
viously published.

The pioneer work in the field of Pacific North American ophiuroids was
done by Lyman (1861), who listed ten species and later increased the figure to
sixteen. Nine species were added to the list by Clark (1911). Neilsen's (1932)
résumé of the material collected during the Mortensen Pacific Expedition of
1914-1916 has been invaluable in the composition of this key.

Excellent work has been done on the Japanese ophiuroids by Matsumoto
(1917); species occurring in the Nanaimo district were listed by Berkeley
(1927); those found in the Philippine seas were presented by Koehler (1922).
For those species occurring along the North American coast, Neilsen (1932)
prepared a key considering the entire area from the Strait of Georgia to the
Gulf of Panama, and Busch (1918, 1921) a key to the ophiuroids of Friday
Harbor, Washington. Barnard and Ziesenhenne (1961) discussed the ophiu-
roid communities of Southern California coastal bottoms. The only works
which are locally applicable are the keys of McClendon (1909) for the San
Diego region and May (1924) for Monterey Bay. McClendon's key is the
only one useful to investigators in Southern California.

Through the work of the investigators noted above, there are now 40
recognized species of ophiuroids from the North American Pacific coast.
Thirty species of ophiuroids are included in this key, ten of which may be
collected intertidally.

Materials used in this study were obtained by employing SCUBA for the
subtidal forms. Some of the intertidal species were collected by the authors;
others were provided by Fred Ziesenhenne of the Allan Hancock Foundation,
University of Southern California.

In this key an attempt has been made to utilize ophiuroid characters which
are least subject to variation and which can be observed externally with a hand

3. adoral plate
4. tentacle scale
5. tentacular pit
6. oral papilla
7. oral shield
8. genital slit
9. interradial portion of disc
10. arm spine
11. 1st oral arm plate
12. side arm plate
lens, requiring no dissection of material. Disc-arm ratios, general shape, color, and other potentially ambiguous characters have been avoided.

Oral papillation is a fundamental key character, but whether enlarged oral tentacle scales should be included in the number of oral papillae per jaw in all cases is questionable. Where these structures are obvious, they have been included (see *Ophionereis annulata*). Together with the key we include a table indicating where the specimens may be found (Table 1), as well as a photograph (Fig. 1) and a diagram showing general diagnostic features (Fig. 2). An illustration showing the details of the oral papillae is included for each species.

The key is in no way a natural one, though for the most part, related genera fall closely together.

**KEY**

I. Both disc and arms covered by a leathery skin; aboral arm plates absent or rudimentary; arms branched (Fig. 3). ............. *Gorgonocephalus eucnemis*

II. Arms never covered by a thickened skin; aboral arm plates present; arms never branched.

A. Aboral disc scaled, though scales may be discontinuous.

1. Oral papillae six or less than six per jaw.
   a. Oral papillae two to four (rarely five) per jaw.
      (1). Individuals often six-rayed; oral papillae blunt.
      (a). Radial shields small, never joining with mate; four smooth spines on each side arm plate; two oral papillae per jaw (Fig. 4). .................................. *Ophiactis simplex*
      (b). Radial shields large; mates joining distally; five (rarely six) spines with fine serration on each side arm plate; four or five oral papillae per jaw (Fig. 5). ............. *Ophiactis savignyi*

(2). Individuals never six-rayed; oral papillae sharp, numbering two or three per jaw; one apical or subapical and two (occasionally three) distal oral papillae.

   (a). One tentacle scale; disc strongly scaled (Fig. 6). ............. *Amphiura diastata*
   (b). Two tentacle scales; disc occasionally not scaled centrally (Fig. 7). ......................... *Amphiura arcystata*

b. Oral papillae six per jaw; three or occasionally four spines per side arm plate.

   (1). Two proximal pairs of oral papillae small; distal pair broad and elongate.
   (a). Interbrachial areas granular; radial shields separate or meeting only distally (Fig. 8). .... *Amphichondrias granulosus*
(b). Interbrachial areas scaled; radial shields in solid contact.
   i. Longest arm spines about 1½ times length of arm joint; arms markedly long and narrow (Fig. 9).
      ......................................................................................... Amphipholis pugetana*

   ii. Longest arm spines about 1 arm joint in length; arms relatively short (about four times the disc) (Fig. 10).
      ......................................................................................... Amphipholis squamata*

(2). Oral papillae all subequal in size and shape.
   (a). Some of the disc scales with free ends prolonged into fine points.
      i. Scales of aboral disc few and large (Fig. 11).
         ......................................................................................... Amphiodia (Amphispina) digitata

      ii. Scales of aboral disc numerous and small (Fig. 12).
         ......................................................................................... Amphiodia (Amphispina) urtica

   (b). Disc scales never prolonged into fine points.
      i. Disc with a rosette of large scales aborally; tentacle scales (2) unequal in size; plates about mouth inflated
         (Fig. 13).
         ......................................................................................... Amphiodia psara

      ii. Disc with fine scales; tentacle scales (2) equal in size; plates about mouth not inflated (Fig. 14).
         ......................................................................................... Amphiodia occidentalis

2. Oral papillae more than six per jaw.
   a. Eight oral papillae per jaw (rarely nine).
      (1). Spines on disc partially covering scales; oral papillae spinose and globose (Fig. 15).
         ......................................................................................... Amphiacantha amphacantha

      (2). No spines present on disc; most oral papillae heavy though a few are terete. Two tentacle scales in angle of mouth often considered to be oral papillae (10).
         (a). Tentacle scales in angle of mouth separate from true oral papillae row; proximal oral papillae heavy and globose; other oral papillae heavy but tapered (Fig. 16).
            ......................................................................................... Amphioplus strongyloplax

         (b). Tentacle scales in angle of mouth closely adjacent to row of true oral papillae; oral papillae tapered and not heavy (Fig.
            17).
            ......................................................................................... Amphioplus hexacanthus

b. Nine or more than nine oral papillae per jaw.
   (1). Oral papillae nine to ten; those in angle of mouth curved and pointed (actually tentacle scales). Tentacle scales large and saucer shaped; three arm spines on each side arm plate.
      (a). Aboral arm plate large; accessory plates very small. Disc with scattered large scales of lighter pigmentation; arms mottled brown and cream (Fig. 18).
         . Ophionereis eurybrachyplax
(b). Aboral arm plates equaled in size by accessory plates; light spots scattered on disc incorporating several small scales; arms banded (Fig. 19) .................. *Ophionereis annulata*

(2). Oral papillae more than ten per jaw; tentacle scales often more than one, neither large nor saucer shaped.

(a). Arm spines sharp, about one arm joint in length; small notches in disc above arm base edged with small papillae; symmetrical scale situated centrally on aboral disc (Fig. 20). ............................. *Ophiura lutkeni*

(b). Arm spines not sharp and considerably less than one arm joint in length; disc notches and symmetrical scale absent; oral papillae in even rows.

i. Oral papillae partially fused; tentacle pores only on first three oral arm plates; aboral arm plates not divided (Fig. 21). ............................. *Ophiomusium jolliensis*

ii. Oral papillae not fused; aboral arm plates divided into many smaller plates; arms flattened (Fig. 22) .................. *Ophioplocus esmarkii*

**B. Scales or plates of aboral disc covered or partially obscured by superficial structures.**

1. Disc covered by a thickened epidermis.
   a. Velvet-like epidermis covering disc; oral papillae and arm spines small and numerous; adults often over twelve inches in diameter (Fig. 23) ............................. *Ophioderma panamense*

   b. Smooth or parchment-like epidermis covering disc in interradial areas; arm spines long, flattened, narrower at base than at end; tentacle scales similar to arm spines and usually held in crossed position on oral surface of arm (Fig. 24) ............................. *Ophiopsis californica*

2. Disc covered with spines or short stumps.
   a. Spines of arms held normally to arm axis (unless improperly preserved).

      (1). Arm spines heavy and flattened; low rounded stumps cover disc; dorsal-most arm spine very short; dental papillae numerous (Fig. 25) ............................. *Ophioptheris papillosa*

      (2). Arm spines rather light and delicate; no oral papillae; disc covered by short spines.

         (a). Arm and disc spines serrated; seven arm spines on each side arm plate (Fig. 26) ............................. *Ophiothrix spiculata*

         (b). Arm and disc spines rather smooth; five or six arm spines on each side arm plate (Fig. 27) ............................. *Ophiothrix rudis*

   b. Arm spines form small angles with arm axis.
(1). Arm spines short and blunt; disc fairly heavily covered with branched spines; small supplementary plates partially surround aboral arm plates (Fig. 28). .................. *Ophiopolis bakeri*

(2). Arm spines rather long and tapered; side arm plates nearly or completely meeting above and below; granules cover most of disc.

(a). Oral papillae twelve to fourteen per jaw; some fine scales in evidence on disc.

i. Spines of considerable size scattered on aboral disc; shorter stumps and granules cover most of balance of disc; oral arm plates well separated by side arm plates; longest arm spine about three arm joints in length (Fig. 29). ....

................................. *Ophiacantha phragma*

ii. Small granules almost completely hiding scales of disc; oral arm plates not widely separated by side arm plates; longest arm spines about five arm joints in length (Fig. 30).

................................. *Ophiacantha diplasia*

(b). Oral papillae seven to nine per jaw; short spines with fine points cover disc.

i. Longest arm spines about two arm joints in length; stumps on disc drawn out to fine (single) points; tentacle scales conical (few scales may show on disc) (Fig. 31).

................................. *Ophiacantha normani*

ii. Longest arm spines about four arm joints in length; disc with short multi-fid spines; tentacle scales not conical; arm spines serrated (Fig. 32). . *Ophiacantha rhachophora*

*Specimens collected intertidally*

*No information available*
DEFINITIONS OF TERMS

Aboral: side opposite the mouth; the dorsal aspect of the animal.

Aboral arm plates: superficial plates covering the dorsal portion of each arm joint.

Aboral plates: shields or plates situated on either side of an oral shield.

Angle of mouth: the distal portion of the slit formed by approximation of any two adjacent jaws.

Disc: the central body of an ophiuroid which is sharply marked off from the arms.

Distal: occupying a position away from the mouth or away from the center of the disc.

Genital scales: scales, usually in orderly rows, bordering the genital slits.

Genital slits: slits located interbrachially and orally on the disc (on either side of each arm base) indicating the position of the genital bursae.

Interbrachial areas: the oral disc lying between adjacent arms.

Jaws: five (or rarely six) triangular structures surrounding the mouth and usually bearing a number of oral papillae laterally and a vertical row of teeth apically.

Oral: the ventral surface as opposed to the aboral or dorsal surface; implying direction toward the mouth or on the same surface as the mouth.

Oral arm plates: those plates situated on the ventral surface of the arm joint through which pass the podia.

Oral papillae: modified spines usually found on the sides of each jaw and bordering the angle of the mouth.

Oral shield: a plate, usually comparatively large, situated on the mid-interbrachial line at the base of each jaw.

Podia: tube feet projecting through the tentacle pores of the oral arm plates.

Proximal: toward the oral-aboral axis; opposed to distal.

Radial shields: plates, often large, existing in pairs and located on or approaching the radius of the aboral disc.

Radius: an imaginary line drawn from the center of the disc to any arm tip.

Side arm plates: those plates covering the lateral aspect of each arm joint and supporting the arm spines.

Tentacle pores: a pair of openings in the oral arm plate through which pass the podia or tentacles.

Tentacle scales: scales found bordering the tentacle pores which, in some species, completely close the tentacle pore.

Tooth papillae: small papillae lying ventrally and about the teeth on the axis of the jaw. (Found in relatively few of the species considered in this key.)
